

Bounce Sprite Off Canvas Edge

Make a ball bounce when it hits an edge of a Canvas.

Edge = 1

Edges are assigned values (1,3,-1,-3)
For top, right, bottom, left

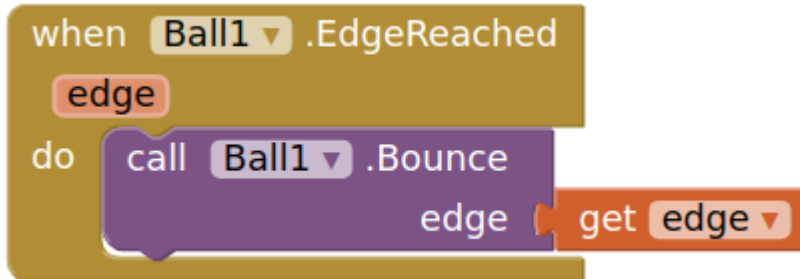

Getting Ready

You will need the following components in your design screen:

* Canvas

* Sprite

Blocks Editor

What does it mean?

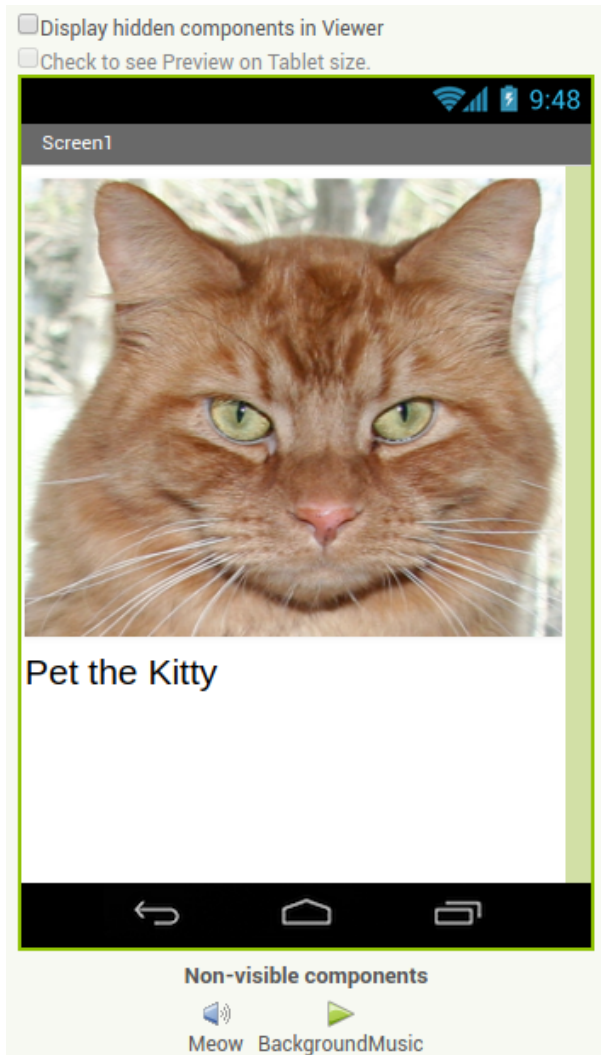

The **Ball1.EdgeReached** event will detect when the Ball sprite hits the edge of the Canvas and provides an argument **edge**. Each **edge** of a Canvas holds a numeric value. So just feed back the same value **edge** into the **Bounce** call.

Ball1.Bounce causes the ball to bounce and move in the opposite direction off the wall (**Ball1.Heading** is changed by 180 degrees).

Adding Sound

Add sound by either adding short audio files
Like a crash sound when two objects collide
Or longer audio files like background music.

Getting Ready

You will need the following components
in your design screen:

- * Button
- * Sound
- * Player

Blocks Editor

```
when Button1 .Click  
do call Meow .Play
```

```
when Screen1 .Initialize  
do call BackgroundMusic .Start
```

What does it mean?

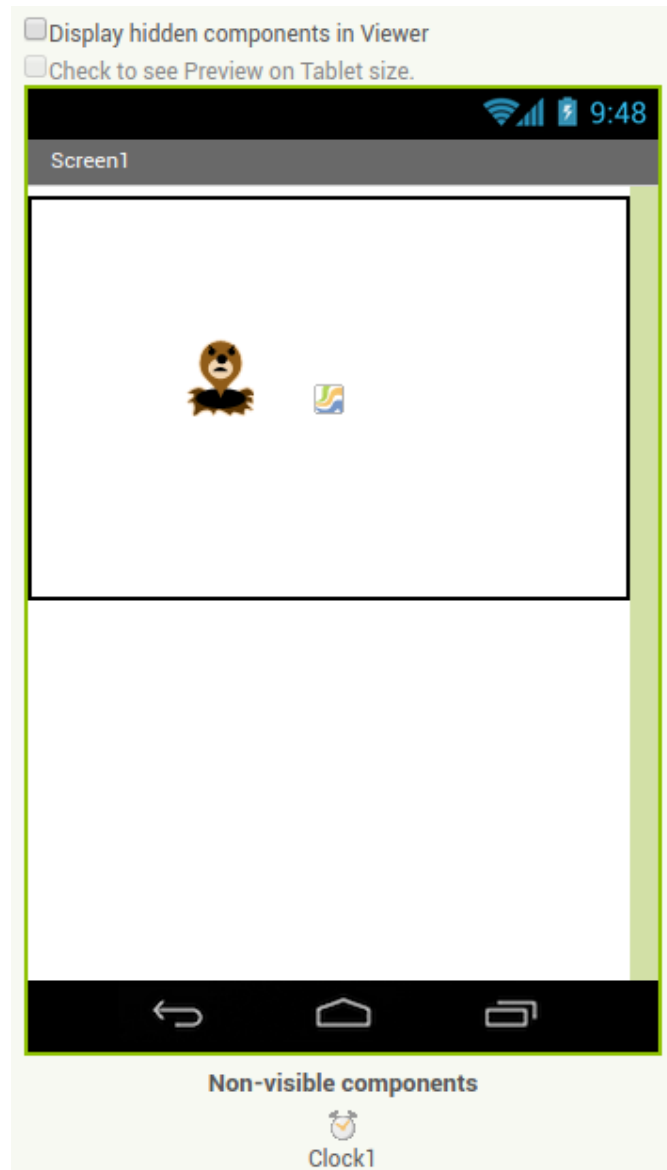

When **Button1** is clicked the **Meow**
Sound will play.

When **Screen1** comes up on your phone
The **BackgroundMusic** will start playing.

Movement on a Timer

Move an ImageSprite with the passing of time.

Getting Ready

You will need the following components in your design screen:

- * Canvas
- * ImageSprite
- * Clock

Blocks Editor

What does it mean?

MoveTo moves an object to an absolute Location on the canvas, not a relative Amount.

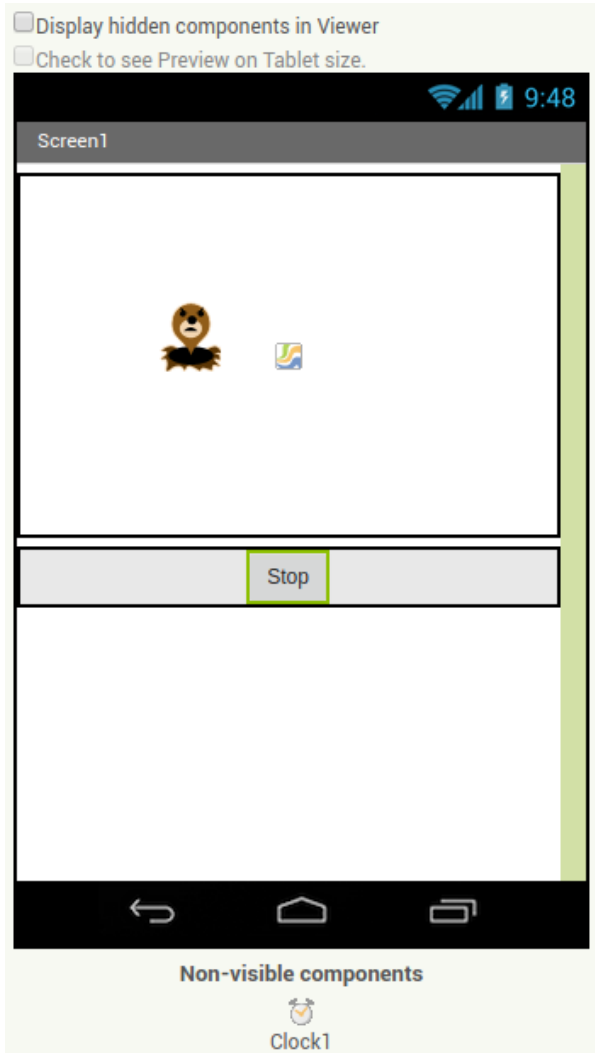

Clock1 has an Interval that specifies how Often the Timer should go off and the Timer Event should be called.

Whenever the **Clock1.Timer** fires the Sprite will move to the right 10 Pixels since the Sprite's Interval is 1.

Start/Stop Timed Movement

This allows the end user to touch a button to start and stop an ImageSprite moving with the passing of time.

Getting Ready

You will need the following components in your design screen:

* Canvas, ImageSprite, Clock, Button

Blocks Editor

```
when Clock1.Timer
do
  call ImageSprite1.MoveTo
  x ImageSprite1.X + 10
  y ImageSprite1.Y

when StartStopButton.Click
do
  if Clock1.TimerEnabled
  then
    set Clock1.TimerEnabled to false
    set StartStopButton.Text to "Start"
  else
    set Clock1.TimerEnabled to true
    set StartStopButton.Text to "Stop"
```

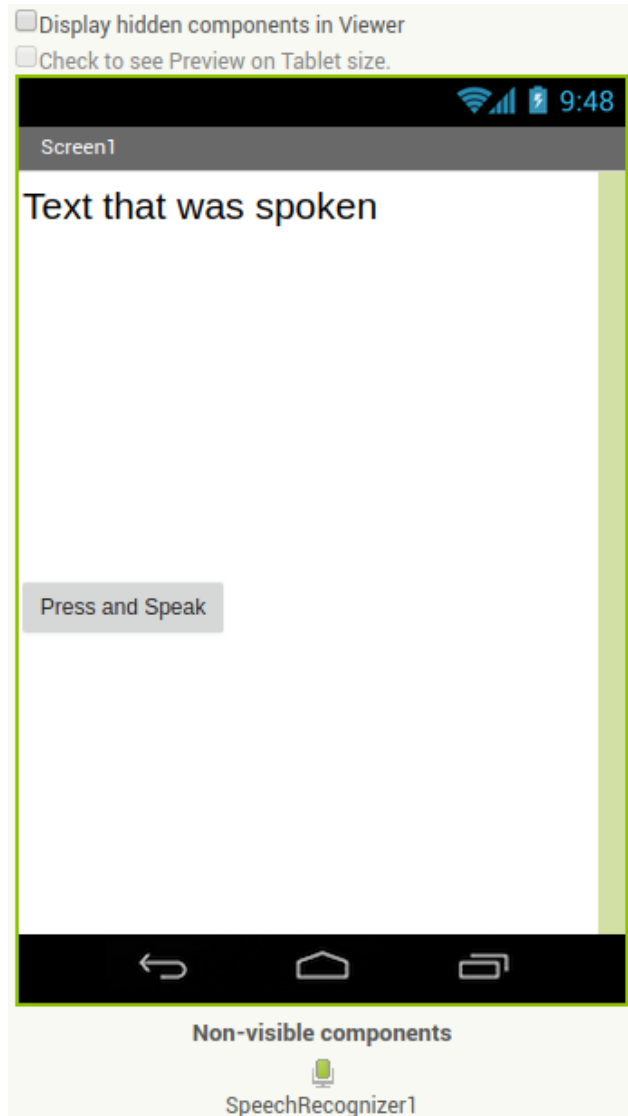

What does it mean?

When the **StartStopButton.Click** is touched, if the Clock is enabled then stop the timer and display Start on the button. This will stop the Sprite's Movement. The opposite will happen when the clock is disabled.

Speech Recognition

Display the text of what is being said on the phone screen.

Getting Ready

You will need the following components in your design screen:

* Label, Button, SpeechRecognizer

Blocks Editor

when **PressAndSpeakButton** .Click

do call **SpeechRecognizer1** .GetText

when **SpeechRecognizer1** .AfterGettingText

result

do set **Label1** . Text to **SpeechRecognizer1** . Result

when **SpeechRecognizer1** .BeforeGettingText

do set **Label1** . Text to " "

What does it mean?

When the **PressAndSpeakButton** is clicked the **SpeechRecognizer** event is called and is ready for you to speak.

The **BeforeGettingText** event will be triggered before speech has been received and recognized.

Then the Label will display no text on the screen.

The **AfterGettingText** event will be triggered once speech has been received and recognized. Then the **Label** will display the text on the screen.

Movement with Sensors

Move an ImageSprite by tilting your phone

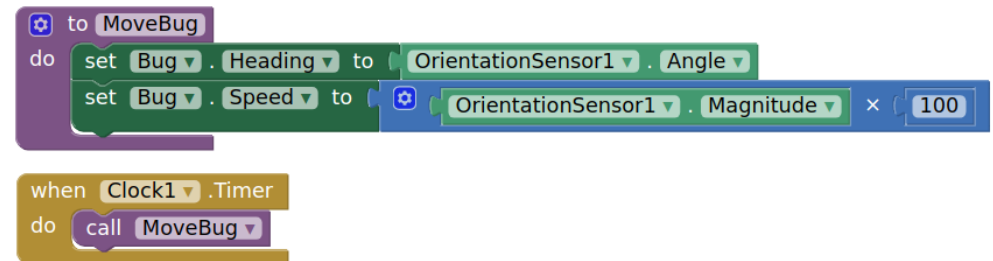

Getting Ready

You will need the following components in your design screen:

* Canvas, ImageSprite, OrientationSensor, Clock

Blocks Editor

What does it mean?

A procedure called **MoveBug** was created that moves the bug in the direction that the phone is tilted.

The **OrientationSensor.Angle** is used to tell the bug which direction to move based on what angle your phone is tilted.

The **OrientationSensor.Magnitude** is used to tell the bug what speed to move based on how much tilt you are putting on your phone.

Whenever the **Clock1.Timer** fires, the event **MoveBug** will be called.

Random Numbers

Generate random numbers to make ImageSprites appear in random (x,y)

Getting Ready

You will need the following components in your design screen:

- * Canvas
- * ImageSprite
- * Clock

Blocks Editor

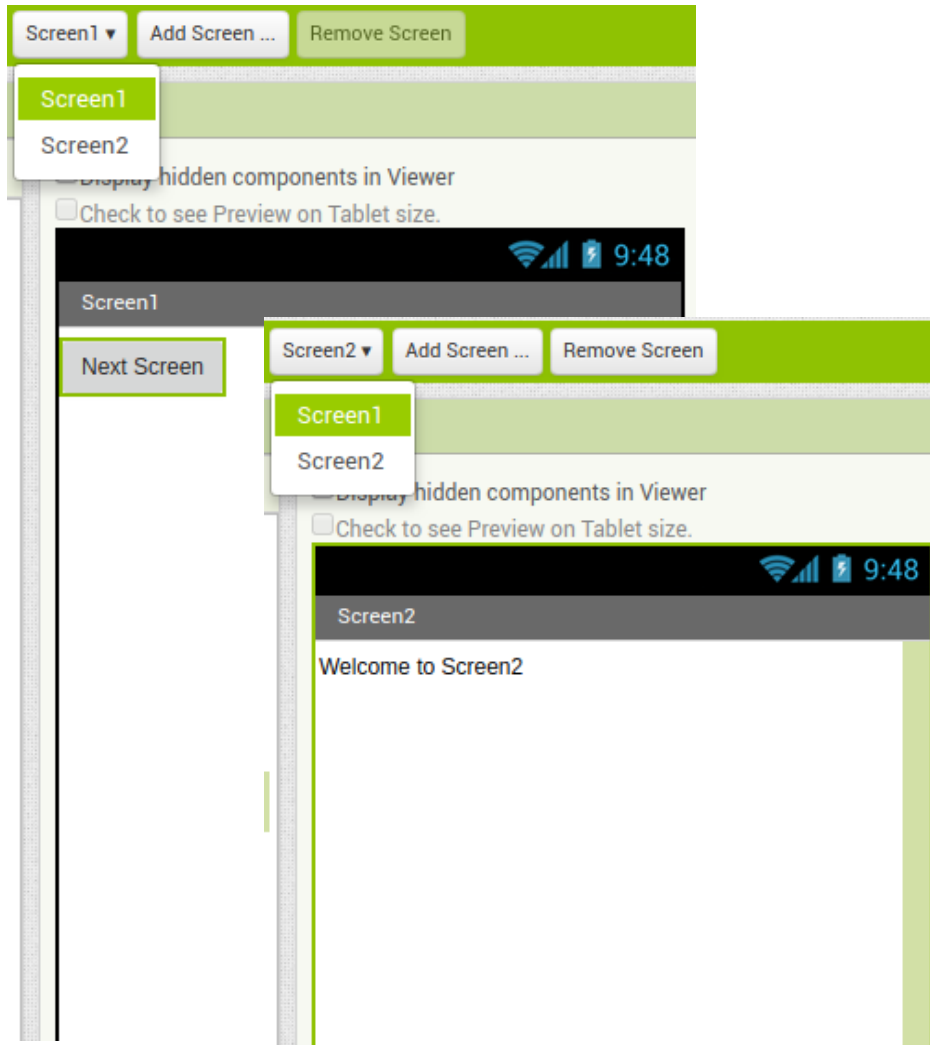

What does it mean?

When the **Clock1.Timer** event is triggered, then **Frog.MoveTo** moves the frog to a random coordinates between the values of 1 and 300 for the x coordinate and 1 and 400 for the y coordinate.

Multiple Screens

Use multiple screens in your app.
Get the next screen by clicking a button.

Getting Ready

You will need the following components in your design screen:

- * Screen1: Button
- * Screen2: Label

Blocks Editor

(For Screen1)

What does it mean?

Open another screen takes in a text block. The text inside this block is the name of another screen. When the button is clicked, Screen2 will be opened.

Creating Your Own Color

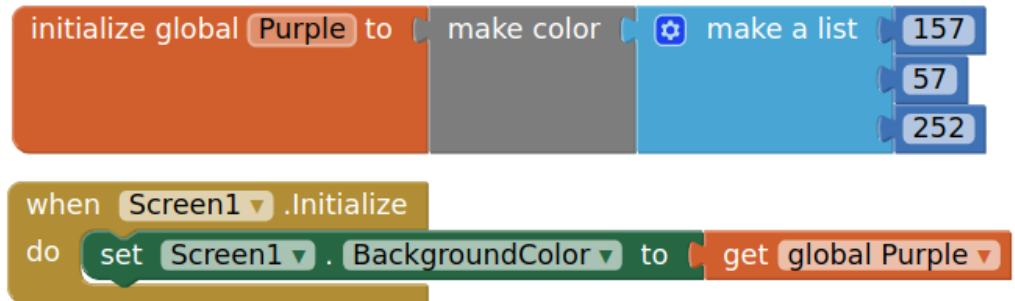

Create your own colors using the make a color block.

Getting Ready

No components are necessary to use Make color.

Blocks Editor

What does it mean?

- **Make color** takes in a list of 4 numbers. The first three numbers represent the RGB values. The last is the alpha or how strong the color is.
- **Purple** is made from using 157 as R, 57 as G, 252 as B and 100 as alpha.
- **When Screen1** is initialized, the background color is set the color we created in the variable Purple.

Fling Movement

Change the heading and speed of a Sprite by flinging your fingers.

Getting Ready

You will need the following components in your design screen:

- * Canvas
- * ImageSprite

Blocks Editor

```
when PirateSprite .Fling
  x y speed heading xvel yvel
do
  set PirateSprite . Heading to get heading
  set PirateSprite . Speed to get speed
```

What does it mean?

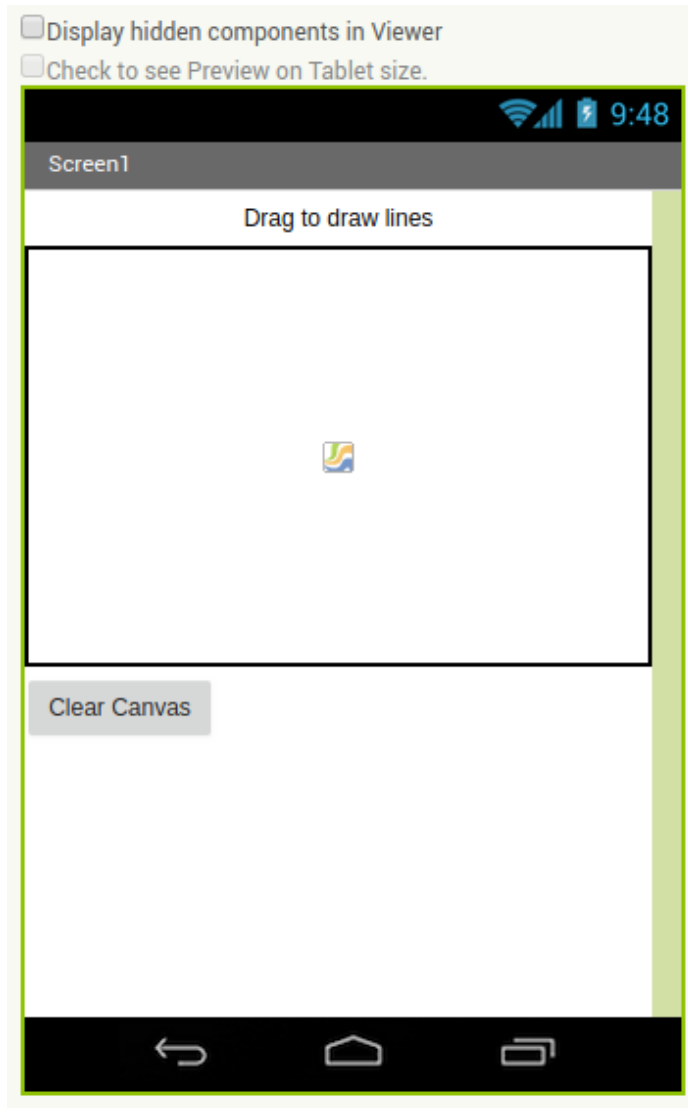

Fling detects when the user makes a fling motion with the sprite across the screen.

The user sets the heading and speed from the fling to the PirateSprite's **Heading** and **Speed**.

Drawing on a Canvas

Drag your finger across the screen to
Draw a curved line along the path of your finger.

Getting Ready

You will need the following components
in your design screen:

- * Canvas
- * Button
- * Label

Blocks Editor

```
when Canvas1 .Dragged
  startX startY prevX prevY currentX currentY draggedAnySprite
do
  call Canvas1 .DrawLine
    x1 get prevX
    y1 get prevY
    x2 get currentX
    y2 get currentY
```

```
when ClearButton .Click
do
  call Canvas1 .Clear
```

What does it mean?

When the **Canvas1.Dragged** event is triggered, a curved line will be drawn from where you finger started on the screen to where it was dragged.

When the **Clear.Click** button is touched the canvas will be cleared.

Shaking Phone

Make something to happen when you
Shake your phone.

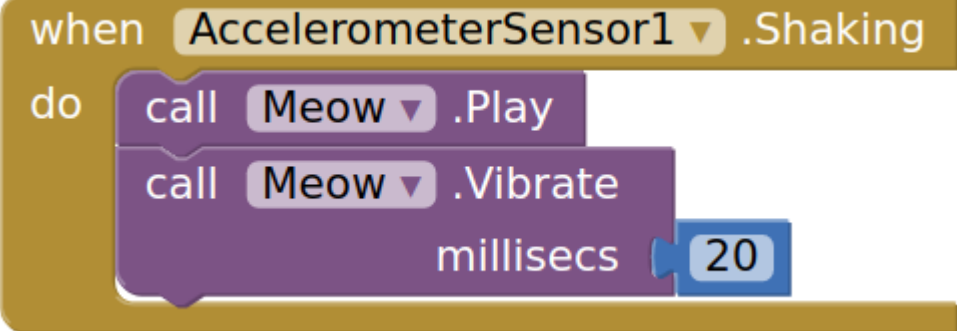

Getting Ready

You will need the following components
in your design screen:

* Image, Sound, AccelerometerSensor, Label

Blocks Editor

What does it mean?

The **AccelerometerSensor.Shaking** event will detect when the phone is shaking and then the Meow sound will play and the phone will vibrate for 20 milliseconds.

Collision Detection

Make something happen when one Sprite Collides with another.

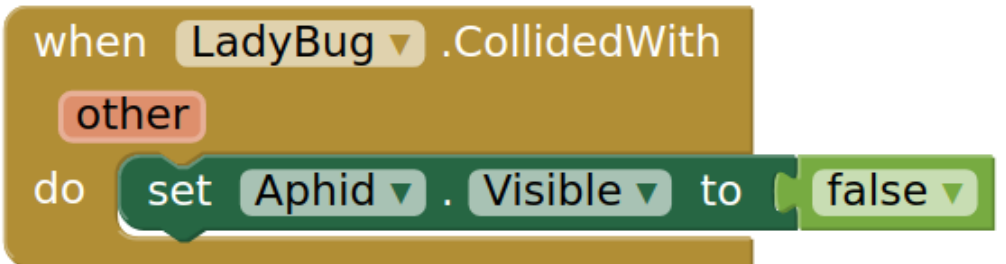

Getting Ready

You will need the following components in your design screen:

- * Canvas
- * Sprite
- * Button

Blocks Editor

HINT: To make your ladybug move by clicking Buttons, check out the Movement cards.

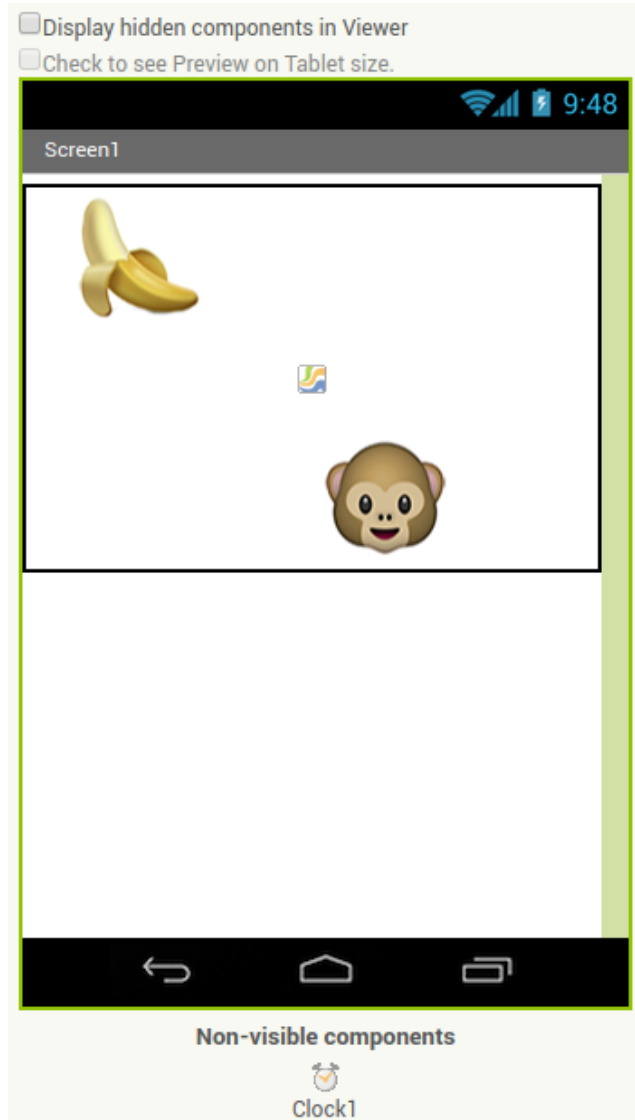

What does it mean?

The **LadyBugCollidedWith** event is Triggered when the Ladybug touches the Aphid. Then this will make the Aphid disappear.

Drag A Sprite

Move a sprite side to side by dragging your finger

Getting Ready

You will need the following components in your design screen:

* Canvas, ImageSprite, Clock
Blocks Editor

```
when MonkeySprite .Dragged
  startX  startY  prevX  prevY  currentX  currentY
do
  call MonkeySprite .MoveTo
    x get currentX
    y MonkeySprite . Y
```

What does it mean?

While the user is dragging the sprite, **MonkeySprite.Dragged** gets called multiple times. Each call has 6 arguments:

- **startX** and **startY**, where the user initially touched the screen.
- **currentX** and **currentY**, where the user is currently touching
- **prevX** and **prevY** hold whatever values were in **currentX** and **currentY** on the previous call to the event. (On the first call of this event, prevX and prevY are the same as startX and startY.)

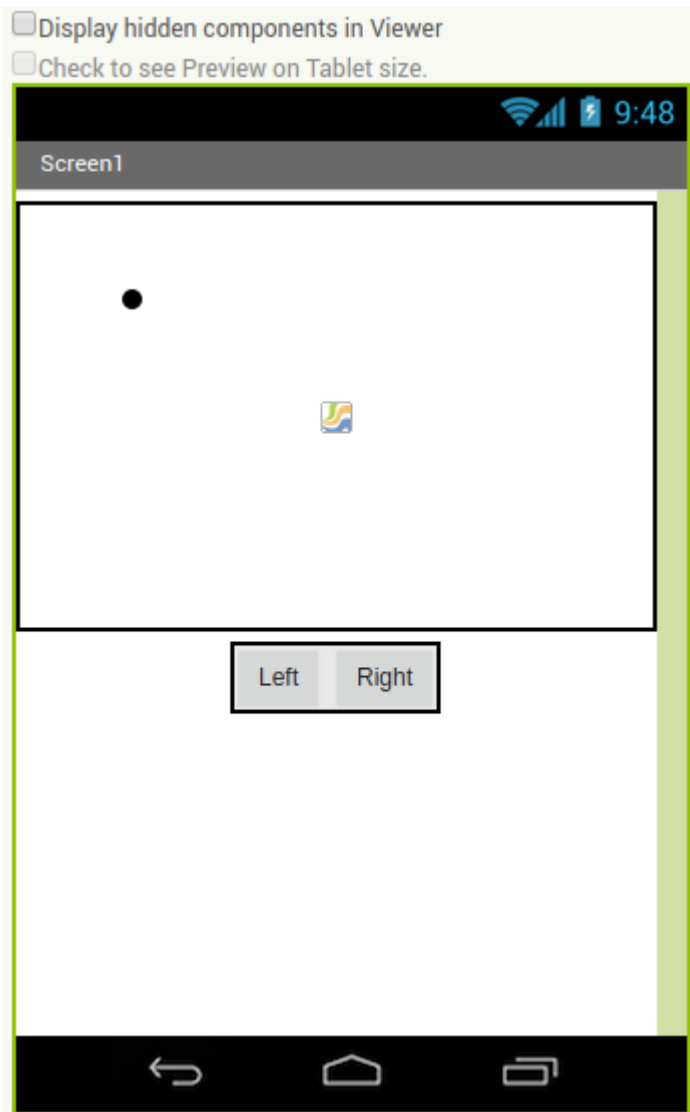

When the user drags the MonkeySprite, it will be moved to the new X location, **currentX**, of the drag. The Y stays the same so the monkey can only move in the X-direction.

Movement with Buttons

Move a sprite by touching a button.

Getting Ready

You will need the following components in your design screen:

* Canvas, Sprite, Button

Blocks Editor

```
initialize global speed to 1
when Left.Click
do set Ball1.X to Ball1.X - get global speed
when Right.Click
do set Ball1.X to Ball1.X + get global speed
```

What does it mean?

Define a **speed** variable to 1 to set the how far the sprite will move each time the button is clicked.

The **Left.Click** event moves the ball to the left every time the button is touched.

The **Right.Click** event moves the ball to the right every time the button is touched.
